Optimizing smallpt

What is smallpt anyway?

1. S

- 2. 99 LoC C++: small path tracer.
- 3. Ported to many languages, including Haskell!
- 4. Haskell port was by Vo Minh Thu. Thanks a ton!
- 5. Start from noteed's original source; SHA the output image from the Haskell source for baseline.
- 6. Perfect for an optimization case study.
- 7. Plan: Quick walk through Haskell code, end up at C++ (clang++) performance.

- ▶ 99 LoC C++: small path tracer.
- Ported to many languages, including Haskell! (Thanks to Vo Minh Thu/noteed).
- Start from noteed's original source; SHA the output image from the Haskell source for baseline.

-11-05

A TL;DR of a path tracer

- 1. S
- 2. Brief spiritually correct description of how a path tracer works
- 3. Main problem: what light ray hits the eye?
- 4. Idea: trace backwards; start from the eye, hypothesize light came from a direction
- 5. Follow the direction, and see if light did indeed come from this direction
- 6. Hypothesize light came from direction r1. Follow and see what happens
- 7. Similarly for r2, r3

Optimizing smallpt

-11-02

A TL;DR of a path tracer

- 1. Let's say our ray hits a light source
- 2. Then we know that the ray came from the light source
- 3. Set color to color of light source

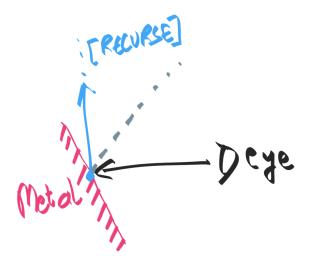

Optimizing smallpt

A TL;DR of a path tracer

- 1. Let's say our ray hits nothing
- 2. Then we know that nothing could have produced this ray.
- 3. Set color to zero

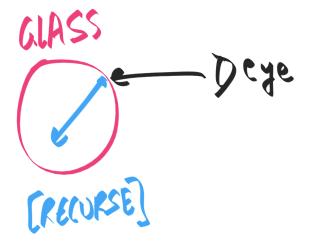

Optimizing smallpt

20-11-05

A TL;DR of a path tracer

- 1. Let's say our ray hit a metallic object. This is neither a light source, nor nothing
- 2. We want to find light rays, which on striking the metal, produce our black right ray
- 3. Use reflection: angle of incidence equals angle of reflection
- 4. Perform math, find light ray that lead to black right ray
- 5. candidate blue ray is shown
- 6. recurse

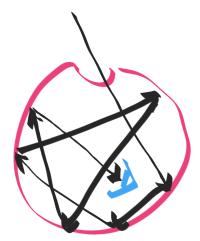

A TL;DR of a path tracer

- 1. Let's say our ray hit a glass object. This is different from all the previous cases
- 2. Here, refraction comes into play
- 3. Perform math, find light ray that lead to black right ray
- 4. candidate blue ray is shown
- 5. recurse

- ▶ When to end recursion?
- ▶ Choose to end recursion *randomly* after some large number of rounds
- "Russian Roulette"

Optimizing smallpt

- 1. Consider a difficult scene like this one, where light can only enter from the top
- 2. Light may need to bounce many times before it enters the eye
- 3. How many bounces do we consider?
- 4. Make longer bounces more unlikely
- 5. Setup a russian roulette system, where the longer a ray has bounced, the more likely it is to die (stop recursing)
- $\ensuremath{\mathsf{6}}.$ increase number of bullets in the gun as number of bounces increase

- ► Recursive (recursively send more light rays)
- ▶ Branching (hit an object? is it a light source? what material?)
- ▶ Number crunching (reflection, refraction, sphere-ray-intersection)
- Randomness (when do we stop a light ray)

```
struct Vec {
 double x, y, z; // position, also color (r,q,b)
 ... methods...
struct Ray { Vec o, d; Ray(Vec o_, Vec d_) : o(o_), d(d_) {} };
enum Refl_t { DIFF, SPEC, REFR }; // material types, used in radiance()
struct Sphere {
 double rad; // radius
 Vec p, e, c; // position, emission, color
 Refl_t refl: // reflection type (DIFFuse, SPECular, REFRactive)
  ... methods ...
 double intersect(const Ray &r) const // returns distance, 0 if nohit
Sphere spheres[] = {//Scene: radius, position, emission, color, material
 Sphere(1e5, Vec( 1e5+1,40.8,81.6), Vec(), Vec(.75,.25,.25), DIFF), //Left
  ... initialization ...
};
```

4 D > 4 A > 4 B > 4 B > B 9 Q (>

What is smallpt anyway?

where the $t_{ij} \approx t_{ij} \approx t_{ij} \approx t_{ij}$ and where (t_{ij}, t_{ij}) and $(t_{ij}, t$

- 1. S
- 2. Has geometric primitives: vectors, spheres, materials
- 3. Entirely numeric-based, no real "data structures" to speak of

```
Vec radiance(const Ray &r, int depth, unsigned short *Xi){
```

```
4□ > 4률 > 4를 > 4를 > 를 되었다.
```

Optimizing smallpt

What is smallpt anyway?

- 1. **S**
- 2. Most of the compute cost is spent in the function that traces rays.
- 3. is called radiance

radiance

radiance

```
Vec radiance(const Ray &r, int depth, unsigned short *Xi){
```

```
radiance
radiance
radiance
```

radiance

radiance

- 1. S
- 2. radiance is the function that performs this path tracing
- 3. Recursively calls itself a bunch of times

```
Vec radiance(const Ray &r, int depth, unsigned short *Xi){
```

```
if (
           ) if (
                                          else
if (
                  ){
                      radiance
} else if (
                      radiance
if (
                      radiance
 radiance
                              radiance
 radiance
                              radiance
```

Optimizing smallpt

- 1. **S**
- 2. Recursion is guarded by a lot of control flow

```
Vec radiance(const Ray &r, int depth, unsigned short *Xi){
```

```
Vec x=r.o+r.d*t, n=(x-obj.p).norm(), nl=n.dot(r.d)<0?n:n*-1, f=obj.c;
            ) if (
if (
                                           else
if (
                   ) {
                       radiance
} else if (
                       radiance
if ((cos2t=1-nnt*nnt*(1-ddn*ddn))<0)
                       radiance
  radiance
                               radiance
  radiance
                               radiance
```

Optimizing smallpt

- 1. **S**
- 2. The control flow and computation is very numeric in nature

```
Vec radiance(const Ray &r, int depth, unsigned short *Xi){
```

```
Vec x=r.o+r.d*t, n=(x-obj.p).norm(), nl=n.dot(r.d)<0?n:n*-1, f=obj.c;
            ) if (erand48(Xi) )
if (
                                            else
if (
                   ){
                  erand48(Xi)
                                  erand48(Xi)
                       radiance
} else if (
                       radiance
if ((cos2t=1-nnt*nnt*(1-ddn*ddn))<0)
                       radiance
                                erand48(Xi)
  radiance
                               radiance
  radiance
                               radiance
```

Optimizing smallpt

What is smallpt anyway?

- 1. **S**
- 2. uses the function erand48 for randomness

```
Vec radiance(const Ray &r. int depth, unsigned short *Xi){
 double t;
                                         // distance to intersection
 int id=0:
                                         // id of intersected object
 if (!intersect(r, t, id)) return Vec(); // if miss, return black
  const Sphere &obj = spheres[id];
                                         // the hit object

[–]Mark entries of Ray and Sphere as UNPACK and Strict $(1.07\times)$

Anne No. - The G. (1992) A. (1992) A

Mark entries of Ray and Sphere as UNPACK and Strict (1.07×)

- 1. D
- Strictness in the arguments means that they're evaluated when instantiated, not when demanded.
- 3. Where as Unpacking removes indirection from doing a memory lookup for components.
- 4. Means we have to copy everything into the data structure that it is unpacked into.
- 5. We don't unpack ray (Lots of calculations on its components, want those to fuse)
- 6. Unpack Sphere its static from compile time
- 7. Don't unpack Ray, because each Vec undergoes a lot of computation.

```

Optimizing smallpt Convert erand48 to pure Haskell (1.09×) Convert erand48 to pure Haskell (1.09×)

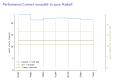

- 1. S
- 2. The entire premise of this talk is that Haskell can be as fast as C.
- 3. We're opening the black box of what erand48 does to GHC
- Further any impedance mismatch, such as FFI almost universally has to have, carries some bookkeeping overhead.
- 5. If our Haskell code was as fast as the C code moving the code into Haskell would be a win, if it was slightly slower it could still be a win.
- 6. Often considering your Haskell code's performance is a better option and easier than reimplementing something in C.
- 7. As is the way with optimizations, this is not universally true.

Performance:Convert erand48 to pure Haskell

Performance:Convert erand48 to pure Haskell

Remove mutability: Erand48 Monad

```

Set everything in smallpt to be strict $(1.17 \times)$

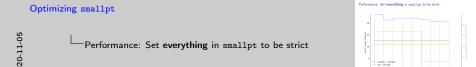

Don't senselessly bang everything in sight.

- 1.
- 2. This is not a recommendation, this is a warning.
- 3. We get a speedup here but it can also regress performance. Some of these bangs are regressions that are hidden.

Performance: Set everything in smallpt to be strict

Why strictness may be bad

```
let foo = let x = error "ERR" in \y -> y let foo0pt = \y -> y
```

Why strictness may be bad

- 1. S
- 2. Consider the function foo and fooOpt. These are equivalent
- 3. The fact that \boldsymbol{x} is not used allows us to eliminiate computing \boldsymbol{x}
- 4. Consider the next version
- 5. Illegal, we need to have x, because it doesn't produce ERR
- 6. we can't equationally reason about the program anymore.
- 7. Makes it harder for GHC. GHC is conservative about bangs
- 8. Inhibits compiler from optimizing

Why strictness may be bad

Why strictness may be bad

```
let foo = let x = error "ERR" in y \rightarrow y let foo0pt = y \rightarrow y let foo' = let y \rightarrow y let foo' = let y \rightarrow y
```

```

Optimizing smallpt

Reduce to only useful strictnesses in smallpt(1.17 imes)

- 1. D
- 2. Thus the compiler can no longer move the computation around or simplify it.
- Force useless work.
- A little thinking about how the variables are used or looking at core allows us to select which ones we bang selectively.

Reduce to only useful strictnesses in smallpt

Use strictness strategically in entire project

```
if det<0 then Nothing else f (b-sdet) (b+sdet)

where op = p - o

eps = 1e-4

b = dot op d

det = b*b - dot op op + r*r

sdet = sqrt det

f a s = if a>eps then Just a else if s>eps then Just s else Nothing

if det<0

then Nothing

else

let !eps = 1e-4

!sdet = sqrt det

!a = b-sdet

!s = b+sdet

in if a>eps then Just a else if s>eps then Just s else Nothing
```

Optimizing smallpt

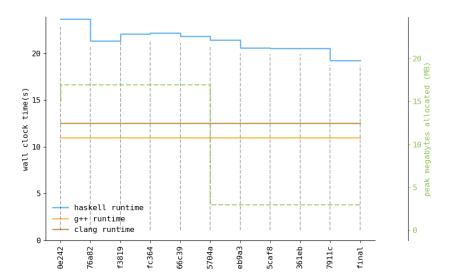

Use strictness strategically in entire project

Use strictness strategically in entire project

- 1. D
- Sometimes (point out 'intersect') we have to rearrange the code though when we use bangs.
- 3. Bangs tell the compiler to make more efficient code, but take away the compiler's options in how to do so.
- 4. Only take away the compiler's liberties when it's using them poorly.
- 5. Becomes intuitive.

Use strictness strategically in entire project

Remove Maybe from intersect(s) $(1.32\times)$

Remove Maybe from intersect(s) $(1.32 \times)$

| The region of the content of the c

Remove Maybe from intersect(s) (1.32×)

- 1. S
- 2. This is a far more performance critical version of what we saw with 'maximum' vs. 'max'.
- 3. innermost functions are of critical importance. remove Maybe which significantly reduces the boxing
- 4. Since a Ray that fails to intersect something can be said to intersect at infinity, Double already actually covers the structure at play
- 5. This also reduces allocation.

Performance: Remove Maybe from intersect(s) (1.32×)

Hand unroll the fold in intersects $(1.35\times)$

```
intersects :: Ray -> (Double, Sphere)
-intersects ray = (k, s)
- where (k,s) = foldl' f (1/0.0, undefined) spheres
+intersects ray =
+ f (... (f (f (intersect ray sphLeft, sphLeft) sphRight) ...)
+ where
    f(k', sp) s' = let !x = intersect ray s' in if x < k' then (x, s') else (k', sp)
-spheres :: [Sphere]
-spheres = let s = Sphere ; z = zerov ; (.*) = mulvs ; v = Vec in
- [ s 1e5 (v (1e5+1) 40.8 81.6) z (v 0.75 0.25 0.25) DIFF --Left
- , s 1e5 (v (-1e5+99) 40.8 81.6) z (v 0.25 0.25 0.75) DIFF --Rght
. . .
+sphLeft, sphRight, ... :: Sphere
+sphLeft = Sphere 1e5 (Vec (1e5+1) 40.8 81.6)
                                                 zerov (Vec 0.75 0.25 0.25) DIFF
+sphRight = Sphere 1e5 (Vec (-1e5+99) 40.8 81.6) zerov (Vec 0.25 0.25 0.75) DIFF
```

Optimizing smallpt

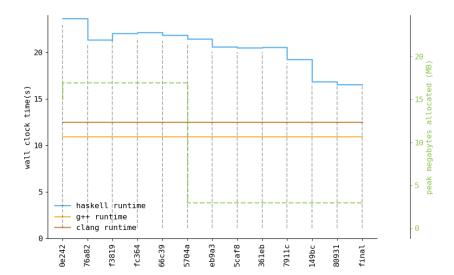

Hand unroll the fold in intersects $(1.35\times)$

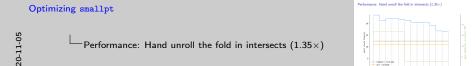

Contraction of the Contraction o

Hand unroll the fold in intersects (1.35×)

- 1. D
- 2. 'intersects' is very hot
- 3. Loop unrolling
- 4. Many compilers do this for us, and there are special versions of it like Duff's Device.
- 5. Sadly GHC doesn't
- 6. Can do variants by hand.
- 7. RULE could handle each one specificly (only exactly that one)?

Performance: Hand unroll the fold in intersects $(1.35\times)$

- 1. D
- 2. Strings are inefficient
- 3. 'bytestring' has some efficient writing code, so we just convert to that for a modest gain.

Performance: Optimize file writing

4□ > 4□ > 4□ > 4□ > 4□ > 4□ > 4□

Performance: Optimize file writing

Use LLVM backend $(1.87\times)$

+package smallpt-opt

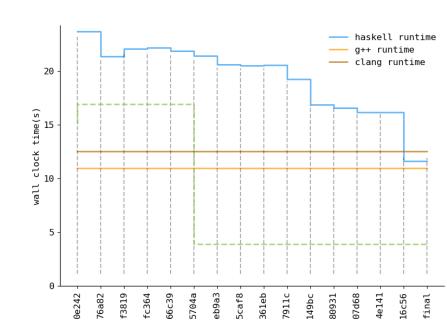

+ ghc-options: -fllvm

- 1. S
- 2. Finally, this particular code is quite numeric heavy.
- 3. There are optimizations for numeric heavy code we're missing in GHC.
- 4. LLVM has an extensive library of laws to optimize low level numeric ops.
- 5. LLVM is too low-level to understand haskell as haskell.
- 6. LLVM makes decisions with the tacit assumption that the assembly came from a C-like language, which is often to the detriment of a Haskell-like language.
- 7. In this case, as the code is "fortran-like", LLVM wins.

The view from the mountaintop

1. **D**

Avoid CPU ieee754 slow paths

```
intersect :: Ray -> Sphere -> Double
 intersect (Ray o d) (Sphere r p _e _c _refl) =
  if det<0
- then 1/0.0
+ then 1e20
   else
    . . .
    in if a>eps then a else if s>eps then s else 1/0.0
    in if a>eps then a else if s>eps then s else 1e20
radiance :: Ray -> Int -> Erand48 Vec
radiance ray@(Ray o d) depth = case intersects ray of
- (T t_) | t == 1/0.0 \rightarrow return 0
+ (T 1e20 _) -> return 0
```

- 1. D
- 2. We used +Inf to match the Maybeness
- 3. C++ code set 1e20 s the horizon
- 4. Mechanical sympathy is important.
- 5. Know how the CPU (abstractly) executes slow path / fast path.

Fix differences with C++ version

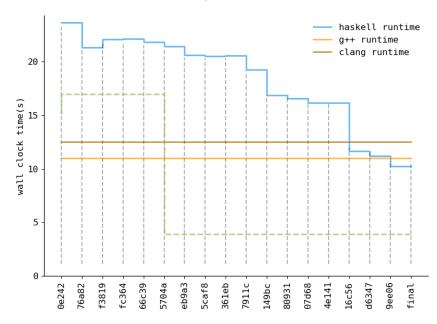

```
- if depth>2
+ if depth'>2 -- depth' = depth + 1
```

- 1. **S**
- 2. Since the sha1 of the output didn't match the C++ version we started investigating.
- 3. clang++, g++ actually produce different sha1s
- 4. unincremented depth was being used in one branch, causing us to do more work
- 5. now confident to say we're doing the same computation as C++

A second view from the mountaintop

Takeaways

- ► The unrolling in 'intersects' is ugly.
- ▶ (We feel) the maintainability of this code hasn't been significantly harmed.
- ▶ We're faster than clang++ and within 6% of g++
- ► Haven't exhausted the optimization opportunities.
- ▶ GHC could learn to do several of these optimizations for us.
- Others are just good Haskell style.
- Clean Haskell is often performant Haskell.
- ▶ Repository stepping through each optimization is available at ...
